Speaking of germplasm orchards, do you happen to know if there are any in the Carolinas? Or other ACF plantings	Daniel Washburn	djwashburn@gmail.com	live answered
They were something that I got for contributiing extra \$ to the foundation	"	salisbury@frontiernet.net	live answered; seed level information that Sara just mentioned. https://support.acf.org/membership
Ordinary citizen here: Who can obtain and plant genetically modified chestnuts?	Frances Verter	fverter@his.com	live answered
Previously planting had to be in a monitored, curated setting . I work for a big water supply agency that does not have such a maintenance program - but we have a lot of land being worked on (this project Westchester County, NY) and I believe this project may go for "Envision" Certification which means we get points for Infrastructure that is 'Environmentally Restorative." (I am an architect with NY City Department of Environmental Protection). So, can we include Chestnuts if we don't do follow- up maintenance? That's my question.	John HARRINGTON	jharrington@dep.nyc.gov	live answered

QUESTION	ASKER NAME	ASKER EMAIL	ANSWER(S)
<p>Partly question, partly comment. We planted in an area that had a high sand content. Did ok until got a dry spell or dry year and did not work out well. They absolutely do not do well on wet soil. You can get very wet soil even on a small ridge. I think there was an under layer of clay.</p> <p>Soil type can change rapidly. Toward top of ridge won't grow. 20 feet lower grow well. Another 20 feet and don't do well.</p> <p>Mid slope has worked best for us. There are always exceptions.</p>	frank	mathob@icloud.com	live answered
<p>Do squirrels do detailed soil surveys? They seem to find the right place for planting a lot of different trees.</p>	frank	mathob@icloud.com	live answered
<p>Old farmland (planting stopped 1930). Compacted layer 2-3" thick at ~14" below surface. Is this fragipan? First 14" contains organic material. Below 16" is sand. Your thoughts on suitability.</p>	Steve Johnstonbaugh	gsjbaugh@verizon.net	<p>live answered</p> <p>Look into that link I put in the chat. might help.</p> <p>Daikon radish helps break up soil. see latest Chestnut mag.</p> <p>Just got the same recommendation (Daikon) from Ernst seed.</p>
<p>What's K-sat?</p>	John HARRINGTON	jharrington@dep.nyc.gov	<p>There is a better explanation in Sara's presentation, that will be posted after the chat, but this may give you some idea: "Saturated hydraulic conductivity" is the ease with which pores of a saturated soil transmit water. Formally, it is the proportionality coefficient that expresses the relationship of the rate of water movement to hydraulic gradient in Darcy's Law (a law that describes the rate of water movement through porous media).</p>
<p>I thought early on you said that you wanted depth to bedrock over four to six feet. But later you talked about depth to bedrock of 60 to 99 inches not being ideal. What am I missing?</p>	Clark Beebe	beebeinnj@gmail.com	live answered

I am following TACF as a representative of North Central Forest Landowners Assoc of Pennsylvania, encompassing forest owners in a 4 county area. In the last chat someone mentioned a planting (or planned planting) near Austin, PA (Potter Co.). Our group is interested in anything like this near us - especially what these folks might be doing. Can you forward any contact info for local work?	Chad	Jesteschad@yahoo.com	live answered Looking for your contact email . . . please send anything you have - 'jesteschad@yahoo.com'
How much confidence can I have in soil explorer estimates? I often find that it lists a single area as having 50% of one type and 30% of another, for example, and I'm not sure what to do with that information.	Tyler Payne	tyler.a.payne@comcast.net	live answered
In Tucker Co. WV. Been planting chstnuts from seed and seedlings for 30 years. Used to be chestnuts all over in the woods here and soil is well drained etc. But all have died after 3-15 years because of blight. I have decided to stop trying until true resistant trees are available. When will that be?	john c, GLIFWC	jcoleman@glifwc.org	live answered
obviously these biophysical parameters are critical for chestnut planting. particularly with respect to potentially being able to plant the OxO tree in the coming years, how might we integrate social criteria with the biophysical to reflect the ways in which restoration is also a socio-cultural process? QUESTION	ASKER NAME	ASKER EMAIL	ANSWER(S)
I've found that indoor grown potted seedlings are susceptible to leaf scorch when moving outside and should be "hardened" via gradual outside exposure before planting. Is this typical/expected?	Brad Price	dbp0@lehigh.edu	live answered Brad, I prefer to give seedlings shade after transplanting, as setting outside to harden them off just exposes them to chipmunks and such.
Is it better to start with smaller or larger trees? I have seen seedlings that stay small for several years and then decide to grow seem to ultimately do better. Do they form a better root system if they stay small several years.? I see a lot of oaks that do that as well.	frank	mathob@icloud.com	live answered

Comment This is one tough tree. It can compete with grass bramble etc. I have had trees that looked dead only to resprout and start to grow. I sometimes think genetic variability is as important as site.	frank	mathob@icloud.com	live answered
Is anyone growing American Chestnuts Bonsai? In England, there is one grower of European Chestnut Bonsai.	Michael Ronayne	michael.ronayne@verizon.net	live answered Trimming any chestnut tree opens up wounds for the blight.
Quick update on the status of pilots & spotters searching for new chestnuts in bloom this season?	Steve Johnstonbaugh	gsjbaugh@verizon.net	live answered
The Bonsai approach is not successful if the tree tap root is not removed before setting the tree in the bonsai pot. Cutting the tap root that is well established can cause a wound to form and an opening for disease. If you cut a root use sulfur powder dust to coat the wound!	john-paulmartin	zephur17@icloud.com
